Dear Hiring Team,

I am writing to apply for an IT support role on your team. I am a Computer Science and Cybersecurity Engineering student finishing my degree at Webster University, and I am looking for a hands-on position where I can deepen my networking fundamentals while contributing to real systems work.

Most of my experience has come from owning production infrastructure end to end rather than observing it. My portfolio at pwn4g3.pages.dev is live and public — the projects linked on it are running, not mockups. I operate a sixteen-service Cloudflare Workers backend with a relational database schema and an automated deployment pipeline; I build and maintain a production site for a client with booking and payment flows; and I built multi-tenant e-commerce infrastructure for a wholesale distributor covering more than a hundred product categories. That work taught me the unglamorous half of the job: domain and DNS administration, deployment, uptime monitoring, and finding the cause when something breaks in production.

Alongside that I do authorized security research from a Kali lab, and I write tests for the controls I build. The administrative access gate on my own site is covered by fifteen tests written specifically for fail-closed behavior and resistance to spoofed request headers, and that suite runs on every deploy.

What I am looking for now is the part I cannot build alone: sitting beside the people who use these systems and learning how a network behaves when something goes wrong. I am available on-site in the St. Louis area, and I am looking for somewhere I can stay rather than a stepping stone.

I reply to every inquiry and would welcome a conversation at your convenience.

Sincerely,

Jake M. Viefhaus
